Abstract

Permafrost occupies 20 million square kilometres of Earth's high-latitude and high-altitude landscapes. These regions are sensitive to climate change and human activities; hence, permafrost research is of considerable scientific and societal importance. However, the results of this research are generally not known by the general public. Communicating scientific concepts is an increasingly important task in the research world. Different ways to engage learners and incorporate narratives in teaching materials exist, yet they are generally underused. Here we report on an international scientific outreach project called "Frozen-Ground Cartoons", which aims at making permafrost science accessible and fun for students, teachers, and parents through the creation of comic strips. We present the context in which the project was initiated, and recent education and outreach activities. The future phases of the project primarily involve a series of augmented reality materials, such as maps, photos, videos, and 3D drawings. With this project we aim to foster understanding of permafrost research among broader audiences, inspire future permafrost researchers, and raise public and science community awareness of polar science, education, outreach, and engagement.

3

40 Introduction

5

6

7

8 41 “Science is not a heartless pursuit of objective information. It is a creative human activity, its

9

10 42 geniuses acting more as artists than as information processors.” (Gould, 1979, p. 201)

11

12 43

13

14 44 Occupying more than 20 million square kilometres (Fig. 1), permafrost is a key landscape

15

16 45 component of high-latitude and high-altitude regions (Brown et al., 1998). Ongoing climate

17

18 46 warming, which is especially acute in the circumpolar North, results in a series of profound

19

20 47 environmental impacts including permafrost thaw and erosion (AMAP, 2017; IPCC, 2013).

21

22 48 This in turn can release organic carbon formerly trapped in frozen soils to the atmosphere,

23

24 49 ultimately enhancing global warming (Schuur et al., 2015). Considering that twice as much

25

26 50 carbon is currently stored in permafrost compared to the atmosphere (Hugelius et al., 2014),

27

28 51 frozen-ground landscapes play a key role in global climate and large-scale biogeochemical

29

30 52 cycles.

31

32 53

33

34

35 54 Across the Arctic, about four million people live in permafrost areas, particularly in Alaska,

36

37 55 Canada, Russia, and Greenland. Frozen-ground landscapes have been used in the past by

38

39 56 various indigenous peoples for settlement and hunting-fishing grounds, resulting in extensive

40

41 57 ‘traditional environmental knowledge’ about these ecosystems. This knowledge provides

42

43 58 valuable resources for science and community planning (Tondu et al., 2014; Calmels et al.,

44

45 59 2015). Still, construction and maintenance of infrastructure in permafrost regions is difficult,

46

47 60 and is further exacerbated by climate change impacts and an urgent need for housing (Melvin

48

49 61 et al., 2016). Hence, permafrost dynamics and interactions with local infrastructure and

50

51 62 communities are of key scientific interest (Fritz et al., 2015).

52

53 63

54

55

56 64 In this context, science communication to stakeholders and the general public is increasingly

57

58 65 important. Several education and outreach initiatives stemming from the International Polar

59

60 66 Year (IPY, 2007-2008) have been proposed in various formats, including field courses,

exchanges with educators and support for early career networks (e.g., Christiansen et al., 2007; Beck et al., 2014; Provencher et al., 2011). Among them, the Permafrost Young Researchers Network (PYRN) and the Association of Polar Early Career Scientists (APECS) foster innovative collaborations among the younger generations and within the whole polar research community (Tanski et al., this special issue). The IPY 10th anniversary invites reflection on past accomplishments and future perspectives on polar research education and outreach.

This *Research Note* reports on an innovative, multidisciplinary, and international education/outreach initiative called “Frozen-Ground Cartoons”. First, we present the initial cartoons, which are a series of illustrated stories related to permafrost research with a focus on fieldwork activities and interactions with local communities. We then discuss ongoing and future outcomes stemming from the cartoons, as well as dissemination strategies.

A collaboration between artists and permafrost scientists

Science education and communication can take many forms, ranging from traditional classroom lectures, or images visible in Google Earth (Ballagh et al., 2007), to more unusual initiatives such as the use of poetry in chemistry classes (Araújo et al., 2015), or analysis of ‘The Simpsons’ in physics curriculum (Perales-Palacios & Vilchez-Gonzalez, 2005). Comic strips or cartoons (the terms are often used interchangeably) can serve as powerful science communication tools: they are visual, generally funny, depict scientific concepts from a different perspective, and can be easily transferred between different language formats and shared via social media (e.g., Dominiczak, 2017; Mignone et al., 2016; Shurkin, 2015). Cartoons effectively connect art and science along visual, narrative and metaphoric axes, and

92 more broadly, they help communicate science to the public and get the reader engaged, an
93 important task of any scientific activity (Farinella, 2018; Tatalovic, 2009).

94
95 **Background**

96 The establishment of early-career researcher (ECR) networks was an important component
97 of education, outreach and communication initiatives during IPY (Krupnik et al., 2011). This
98 culminated in the establishment of APECS and PYRN in 2005 (Baeseman et al., 2011; Tanski
99 et al., this special issue), which now reach out to as many as 5000 and 1200 members,
100 respectively. Also emerging from the IPY legacy were two major research programs dedicated
101 to permafrost research: the pan-Canadian program, Arctic Development and Adaptation to
102 Permafrost in Transition (ADAPT), and the pan-European program, Changing Permafrost in
103 the Arctic and its Global Effects in the 21st Century (PAGE21). These interdisciplinary
104 research programs provided organizational and financial support for a network of ECRs who
105 actively engaged with APECS and PYRN. This collaboration resulted in a publication outlining
106 the future directions of permafrost science from the perspective of ECRs (Fritz et al., 2015).

107
108 **The “Frozen-Ground Cartoons” (FGC) project**

109 The FGC project was initiated in 2015 by a core group stemming from the ECR collaboration
110 (Fritz et al., 2015), and its aim was to develop a series of informative comics for school kids
111 and teachers. The comics address important concepts about permafrost (e.g., distribution and
112 dynamics of frozen ground, including human impacts, fieldwork activities) and were intended
113 to be used for education and outreach of permafrost science worldwide, therefore contributing
114 to the recruitment of the next generation of permafrost scientists.

115
116 Finding artists

1
2
3 117 The project was officially launched as a two-year 'Action Group' funded by the International
4
5 118 Permafrost Association (IPA). An application call for illustrators was sent through a number of
6
7 119 national and international networks as well as through email lists related to art and science
8
9 120 communication. A total of 49 applications were received from 16 different countries (Fig. 2).
10
11 121 Following an evaluation process (Fig. S1), 10 applicants were selected to submit a one-page
12
13 122 cartoon 'pitch'. Applicants were provided with material specific to permafrost research (e.g.,
14
15 123 fieldwork pictures, sketches, non-specialist texts). After a second round of evaluation, two
16
17 124 artists were selected based on overall quality and potential to reach a large audience: Heta
18
19 125 Nääs from Helsinki (Finland), and Noémie Ross from Montréal (Canada).
20
21
22 126

23 24 127 Developing stories

25
26 128 The following year was spent developing different scenarios and characters, an iterative
27
28 129 process involving both the artists and the scientists via several online meetings and a one-day
29
30 130 workshop. With topics suggested by the science group, the artists were ultimately given
31
32 131 complete freedom to interpret the content and draft stories and characters (Fig. 3). After
33
34 132 completion of the first drafts of the comics, the science group provided feedback to the artists,
35
36 133 and edits were made until everybody agreed on final versions. A one-minute video trailer of
37
38 134 the project, titled 'FrostByte', was released in late 2017
39
40 135 (<https://frozengroundcartoon.com/2017/12/08/frozen-ground-cartoon-frost-byte/>).
41
42

43 136

44 45 137 Translations and science outreach

46
47 138 Final English versions of the FGC were completed in 2017 and culminated in a 28-page printed
48
49 139 booklet containing all the cartoons, as well as a foreword and an illustrated permafrost
50
51 140 glossary (Nääs et al., 2017) (Fig. 4). The booklet has been published under a creative
52
53 141 commons license (CC) including an ISBN number and a permanent doi. Meanwhile, a
54
55 142 Swedish version was produced and printed for the Bolin Centre Climate Festival held in
56
57 143 Stockholm in May 2017 (Fig. 5). The Swedish version included translations of the comics, as
58
59 144 well as back covers that presented illustrations of permafrost distribution and reindeer herding
60

145 in Scandinavia. The French version was released in October 2018 as a feature event of the
146 'Fête de la Science', held across France.

147
148 Currently, cartoons are being translated into Russian and German, the focus in 2019 being on
149 languages spoken in permafrost regions or by stakeholders in permafrost science (e.g.
150 Inuktitut, Komi, Yakutian, Korean, Japanese, Chinese). Particular attention will be put to the
151 translation into indigenous languages, which are rarely represented in specialized and
152 mainstream media. This will give native speaker groups access to the scientific narratives on
153 permafrost and environmental research in their own language and further enable and
154 empower them to take part in local, regional and global dialogues about permafrost
155 degradation impacts across the Arctic.

157 Other ongoing and future outcomes

158 Augmented Reality (AR) material

159 We are in the process of complementing our cartoons with AR material during the next years.
160 We will produce maps, photos, videos, and 3D drawings that will be readily available *via* an
161 application developed for smartphones and tablets (Fig. 6). Maps will allow the user to
162 dynamically visualize in 3D and understand (i) permafrost distribution around the world, (ii)
163 climate warming amplification in the Arctic, and (iii) erosion processes in permafrost areas and
164 their consequences for the environment and the local population. Secondly, we will use
165 numerous fieldwork photos gathered by scientists through the years, and 3D drawings
166 developed from these photos, to highlight permafrost properties (Fig. 7). We will also present
167 tools and equipment used for permafrost research, typical ecosystems or wildlife species, and
168 how house construction is adapted to the Arctic. Finally, educational videos will provide
169 information about (i) permafrost physical properties, (ii) fieldwork campaigns¹, (iii) sample

¹ <https://www.youtube.com/watch?v=2zKSZRHlzQU>

collecting and analyzing in the field and in the laboratory, (iv) climate change impacts and mitigation strategies, and (v) inputs on how scientists collaborate with local communities to co-produce knowledge. This will provide an innovative way of presenting permafrost science to a wide range of diverse user groups.

Board game

The objective of this initiative is to build a high-quality science-themed game, associated with the AR material, where permafrost science itself drives the gameplay. We will use a multiplayer permafrost world map platform (Fig. 1) to engage the whole family or the whole classroom in educative travel. Questions will be split into six categories: geography, physics, chemistry, biology, social sciences, and history. Players will test their knowledge, visualizing AR tools at each step of the game. As young permafrost scientists, they will innovate, test hypotheses, publish articles, and collaborate with stakeholders or with other scientists.

Dissemination and plans for formal evaluation

Innovation of new technologies has led to the development of new approaches to encourage dialogue between scientists and the general public and students, while also inspiring people to take an active role in science. The goal of the FGC project was to develop an outreach tool to effectively engage with a number of audiences, such as targeted students, schools, discipline-specific networks, professional bodies, and educational communities. With this aim, the project combines traditional and innovative ways of communicating knowledge about permafrost.

First, the cartoons were presented in schools. The Swedish version of the comics was printed for distribution to school children in the Stockholm area. The cartoons were also presented and distributed to high school students and teachers in a scientific activity in connection with

the Arctic Frontiers Conference in Tromsø (Norway). With these school activities, we have initiated an informal evaluation of the comics, which focuses on the inspirational aspects (Are the comics liked? Are they fun and inspiring?), the learning outcomes (What do the children learn from reading the comics?), and the teaching aspects (Are the teachers helped in their work by the comics?). The evaluation is performed through a short quiz as well as by a drawing exercise named “Design the ultimate permafrost-meter!” (Fig. S2). The results will help in planning new comic-based outreach material, as well as how to best use the comics in outreach and education efforts as part of a formal evaluation process.

As a second step, we actively involved different target groups through the development of a website: <https://frozengroundcartoon.com/>. Since its launch in July 2017, we have recorded over 11,700 views from 3730 people from 87 countries (by 17 December 2018). The majority of the visitors were from countries with strong permafrost research programs, such as Canada, United States, Germany, Russia, and Scandinavian countries. However, there have also been visitors from less expected countries such as Saudi Arabia, Malaysia, Cyprus, and Peru. Scientists interested in the project can get updates on the project via the project blog on Researchgate² or on the main website.

To inform and encourage permafrost scientists to use these resources, the project was presented at scientific conferences. In late 2017, the first copies of the booklet were distributed at the American Geophysical Union Fall Meeting (Sjöberg et al., 2017) and at the International Arctic Change 2017 Conference (Paquette et al., 2017). During the IPA Action Group period, spanning two years between January 2016 and January 2018, a total of 10 presentations were made at a range of scientific and general public events (Table S1).

221 Conclusions

222 Teaching and communicating science to the public, especially to school children, can
223 sometimes be a daunting task. Cartoons can be used to extract essential information on
224 complex environmental and social issues and tell stories that capture readers' interest,
225 including groups that are underserved by other channels of science communication. Polar
226 science, including permafrost science, lends itself well to this kind of outreach activity (e.g.,
227 fieldwork in remote areas, spectacular landscapes, fossilized mammoth bones, cultural
228 heritage of Arctic communities).

229

230 From the very beginning, Frozen-Ground Cartoons were meant to provide permafrost science
231 concepts and materials in a casual, popular, and efficient way. Based on the comments
232 received so far from scientists, teachers, and the general public including children, the project
233 seems to be moving in the right direction. Yet, there are still a lot of opportunities to extend
234 this work and we provide future ideas and directions to bring our science to new audiences.
235 Augmented reality material is gaining popularity and relevance in the science curriculum as
236 well as in education and public outreach activities, and we are adapting this new reality to
237 permafrost science communication. Combined with the proposed board game for families and
238 classrooms, there is truly an opportunity to take this outreach project to another level. Besides
239 funding, the only limit for future developments seems to be our imagination.

240

241 Acknowledgements

242 We sincerely thank the artists, Heta Nääs and Noémie Ross, for creating engaging permafrost
243 stories and characters. We are also grateful to Bethany Deshpande, Audrey Veillette and
244 Stefanie Weege for participating in the production of the scientific material shown in the
245 booklet, and to Warwick F. Vincent for reviewing early drafts of the cartoons. Financial support

Figure captions

Figure 1. Permafrost distribution map in the Northern Hemisphere (Brown et al., 1998).

Figure 2. Provenance (country or territory of residence) of the applications received (n = 49) during Winter 2016 (<https://frozengroundcartoon.com/the-process/>).

Figure 3. Preliminary sketches in 2016. Left: preliminary character bios shown as a mind map. Right: preliminary ideas for one specific character. Drawing credit: Heta Nääs.

Figure 4. Sample of the illustrated permafrost glossary (Nääs et al., 2017).

Figure 5. Sample of the Swedish version, produced for the Bolin Centre Climate Festival held in Stockholm in May 2017. Drawing credit: Heta Nääs.

Figure 6. Examples of augmented reality materials that can be developed based on different products. Above: from a science school book. Below: from a card game about phytoplankton. Pictures: courtesy of J. Sansoulet.

Figure 7. Examples of sketches that could be used to develop AR material. Left: permafrost distribution varying with latitude (source: @Science-Art.com). Right: permafrost and ground ice illustrated with 3ds Max and Photoshop (source: @Vladimir Andreev).

Figure 1. Permafrost distribution map in the Northern Hemisphere (Brown et al., 1998).
